# CSC 3380 Final Project Presentation Guidelines

The Final Project Presentation is due at 11PM, April 24

For the final project presentation, you will upload a video or set of videos, in which all team members participate in the presentation of the project accomplishments. The videos can be PowerPoint presentation recordings, Zoom meeting recordings, or a digital video (e.g., a phone video).

Each team member should introduce himself/herself at the beginning of their portion of the presentation. An image of the team member does not necessarily need to be visible in the presentation (e.g., during a PowerPoint presentation recording). The timing of all submitted videos is limited to 5 minutes total.

The final project presentation should include the following information:

- Team name and product name
- The team members, and their role in the project
- A description of the problem and the proposed solution
- The system architecture, which includes the component diagram, the data flow diagram, the identification of external data sources and systems, and high-level control flow
- The designs of the main system components, which includes the component diagram, the data flow diagram, specifications of internal data stores (if any), and a very brief description of each component interface
- Identify the components within the design that incorporates a design pattern, and walk through the class diagram of those components, demonstrating the design pattern
